

Business Insights Report

HR Analytics & Employee Attrition Dashboard

Project focus: Workforce composition, employee attrition, compensation, satisfaction, overtime, business travel, tenure and performance.

1. Executive Summary

This report summarizes the HR analytics dashboard built from a 37-employee dataset. The analysis is designed to help management understand workforce composition and identify employee groups that may need retention attention. Across the dataset, 4 employees are marked as having left the organization, resulting in an overall attrition rate of 10.81%. The clearest pattern in this sample is the higher attrition rate among employees working overtime compared with employees who do not work overtime.

Important: The dataset is small (37 employees), so the findings should be treated as directional project insights rather than statistically representative organizational conclusions.

2. Key Performance Indicators

KPI	Value	Interpretation
Total Employees	37	Employees represented in the dataset
Attrition Count	4	Employees with Attrition = Yes
Attrition Rate	10.81%	4 divided by 37
Average Monthly Income	10,785	Mean monthly income in the supplied data
Average Job Satisfaction	2.41 / 4	Overall satisfaction level
Average Age	41.0 years	Mean employee age
Average Tenure	10.89 years	Mean years at company

3. Key Business Insights

- **Overtime is a major retention signal in this sample.** Attrition among overtime employees is 25.0% (3 of 12), compared with 4.0% (1 of 25) among employees without overtime.
- **Human Resources has the highest department-level attrition rate in the supplied dataset.** It records 2 attritions among 6 employees (33.3%), while Research & Development records 2 among 25 (8.0%) and Sales records 0 among 6.
- **Sales Executive is the job role with the highest attrition count.** Two of the four observed departures are Sales Executives, followed by one HR Specialist and one Manager.
- **Attrition occurs across different satisfaction levels.** Two departures are from employees with satisfaction rating 4, while ratings 1 and 2 each have one departure. Satisfaction alone does not explain all exits in this sample.
- **Performance ratings are mostly stable.** Most employees have a rating of 3, with the remainder at 4. Three of the four departures are in the rating-3 group.

4. Supporting Analysis

4. Supporting Analysis (continued)

5. Recommended Business Actions

- **Review overtime workload:** monitor overtime frequency, workload balance and manager-level workload allocation, especially in teams with repeated overtime.
- **Prioritize retention reviews in HR and Sales Executive roles:** use stay interviews, manager check-ins and role-specific engagement actions.
- **Combine satisfaction with other indicators:** monitor overtime, tenure, travel and compensation alongside satisfaction instead of treating one factor as a standalone attrition predictor.
- **Build a repeatable HR monitoring cadence:** refresh the dashboard regularly and track attrition rate, voluntary exits, department rates and role-level rates over time.
- **Improve data scale and quality:** use a larger historical dataset with exit reason, hiring date, salary band, manager, location and monthly/quarterly attrition to support stronger conclusions.

6. Power BI Dashboard Validation Notes

For all attrition visuals, the dashboard should use a dedicated measure that filters **Attrition = Yes**. Using a generic 'Count of Attrition' field counts both Yes and No records and can materially overstate attrition charts.

```
Attrition Count = CALCULATE(COUNTROWS(hr_data), hr_data[Attrition] = "Yes")
```

The Attrition Rate card should use $\text{DIVIDE}([\text{Attrition Count}], [\text{Total Employees}], 0)$ and be formatted as a percentage.

Prepared for the HR Analytics project based on the supplied employee dataset.
